

To Repeat or Not to Repeat? Redesigning Repeating Auditory Alarms Based on EEG Analysis

Yi-Chen Lee, **Fu-Yin Cherng**, Jung-Tai King, Wen-Chieh Lin
Dept. of Computer Science, Brain Research Center,
National Chiao Tung University, Taiwan

Better designs to increase usability

[Brewster, 1995; Garzonis 2009;
Ilijedahl, 2010; Setlur, 2014]

- Monitor contextual information & alert to unusual events
- Alarms will ring **repeatedly** to attract attention

[Patterson, 1990; Edworthy, 2006; Waltrip, 2018]

Study an alarm as an **independent** stimulus,
without considering the **repeating situation**

[Bravo-Lillo, 2013, 2014; Anderson, 2015]

Habituation

Habituation

Repetition **S**uppression

[Sams, 1984; Müller, 2005; Karmner, 2010]

Repetition **S**uppression

Habituation

- Less awareness & can't attract enough attention
- Dangerous in information-dense environments

[Patterson, 1990; Edworthy, 2006; Waltrip, 2018]

Goal

To reduce RS,

Goal

To reduce RS, we propose method of inserting **modulated alarms** into a series of identical ones

No extra effort to memorize new alarm

Goal

To reduce RS, we propose method of inserting **modulated alarms** into a series of identical ones

Pitch
modulation

Intensity
modulation

Cognitive Measures

Electroencephalography

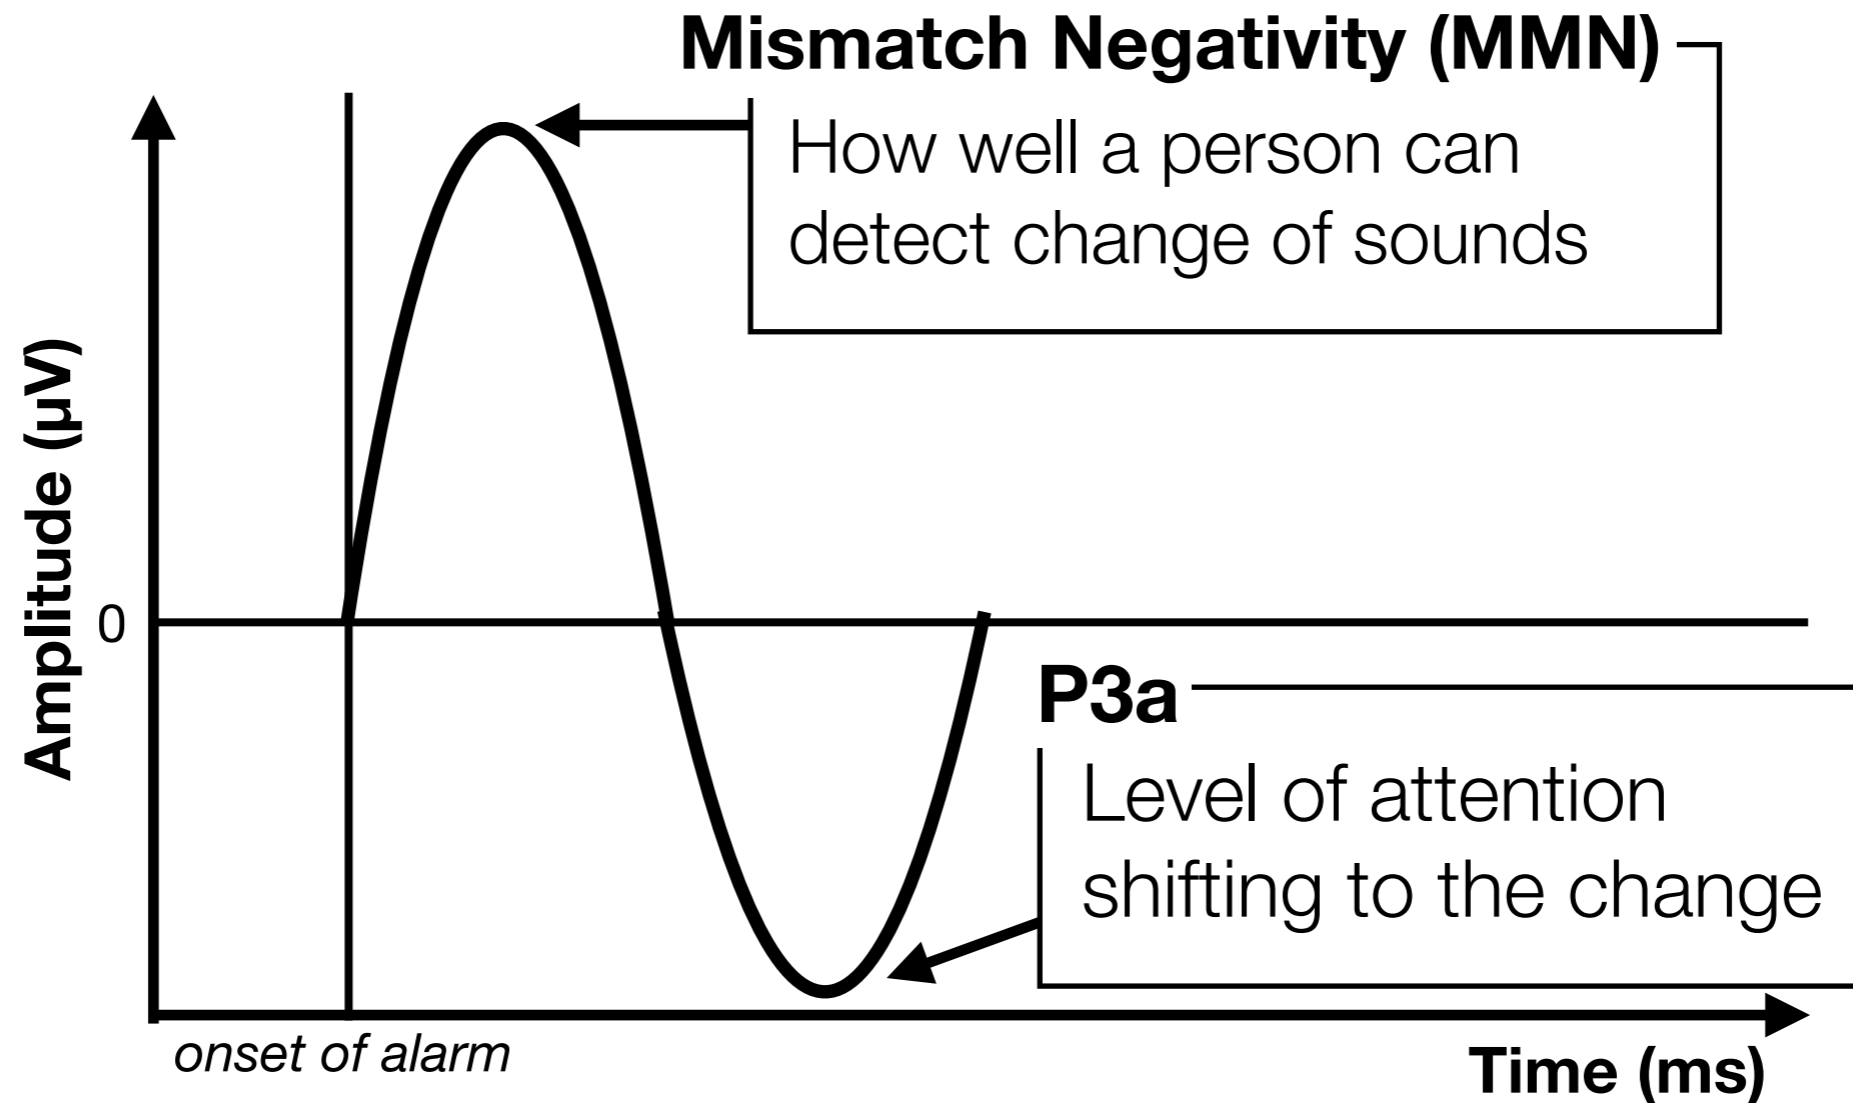

Conducted **EEG** experiment to examine effects of our modulations on repetition suppression

- Direct information to cognitive functions
- Use to study RS

[Sams, 1984; Müller, 2005; Rosburg, 2018]

Metric for RS

RS on MMN & P3a

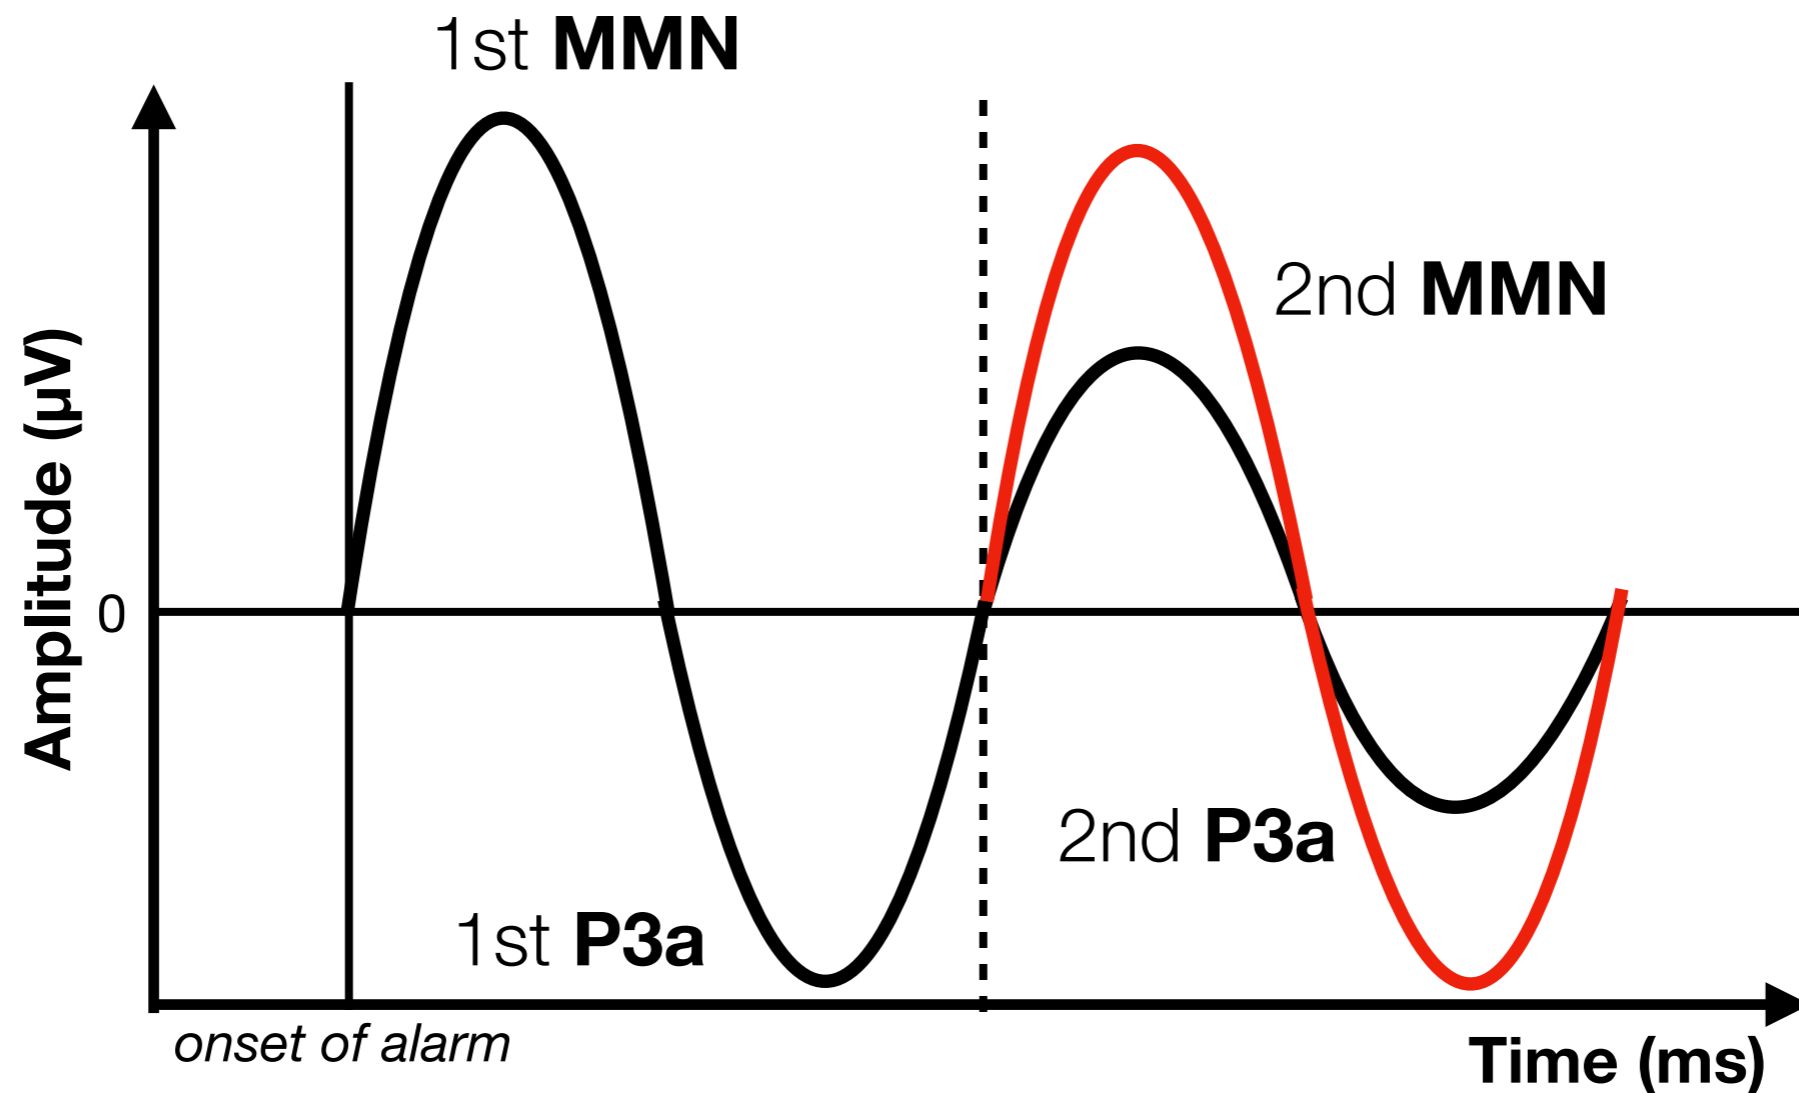

1st

2nd

Change Features of Sound can Reduce RS

1st

2nd

Prior studies used **single tones** as background
and repeated alarm **twice**

[Sams, 1984; Müller, 2005; Rosburg, 2018]

Prior studies used **single tones** as background and repeated alarm **twice**

[Sams, 1984; Müller, 2005; Rosburg, 2018]

We used **real-life** ambient sound as background and repeated alarm **five** times

Research Question 1

Whether we can observe RS in a more realistic setting compared to prior studies?

Research Question 1

Whether we can observe RS in a more realistic setting compared to prior studies?

Research Question 2

Can the proposed modulations reduce RS?

Experiment Setting

🔊 Auditory Stimuli

14 Participants
(8 males; 21-26 years old)

Auditory Stimuli

A: basic alarm (sine wave; 1000 Hz, 70 dB SPL)

P: pitch-modulated alarm (**1500 Hz**, 70 dB SPL)

I: intensity-modulated alarm (1000 Hz, **79 dB SPL**)

Dev 1	A	A	A	A	A
Dev 2	A	P	A	P	A
Dev 3	A	I	A	I	A

Isolated Session

- **Dev 1 (AAAAA)** and ambient sound (70 dB)
- **RQ 1.** Whether we can observe RS?

Mixed Session

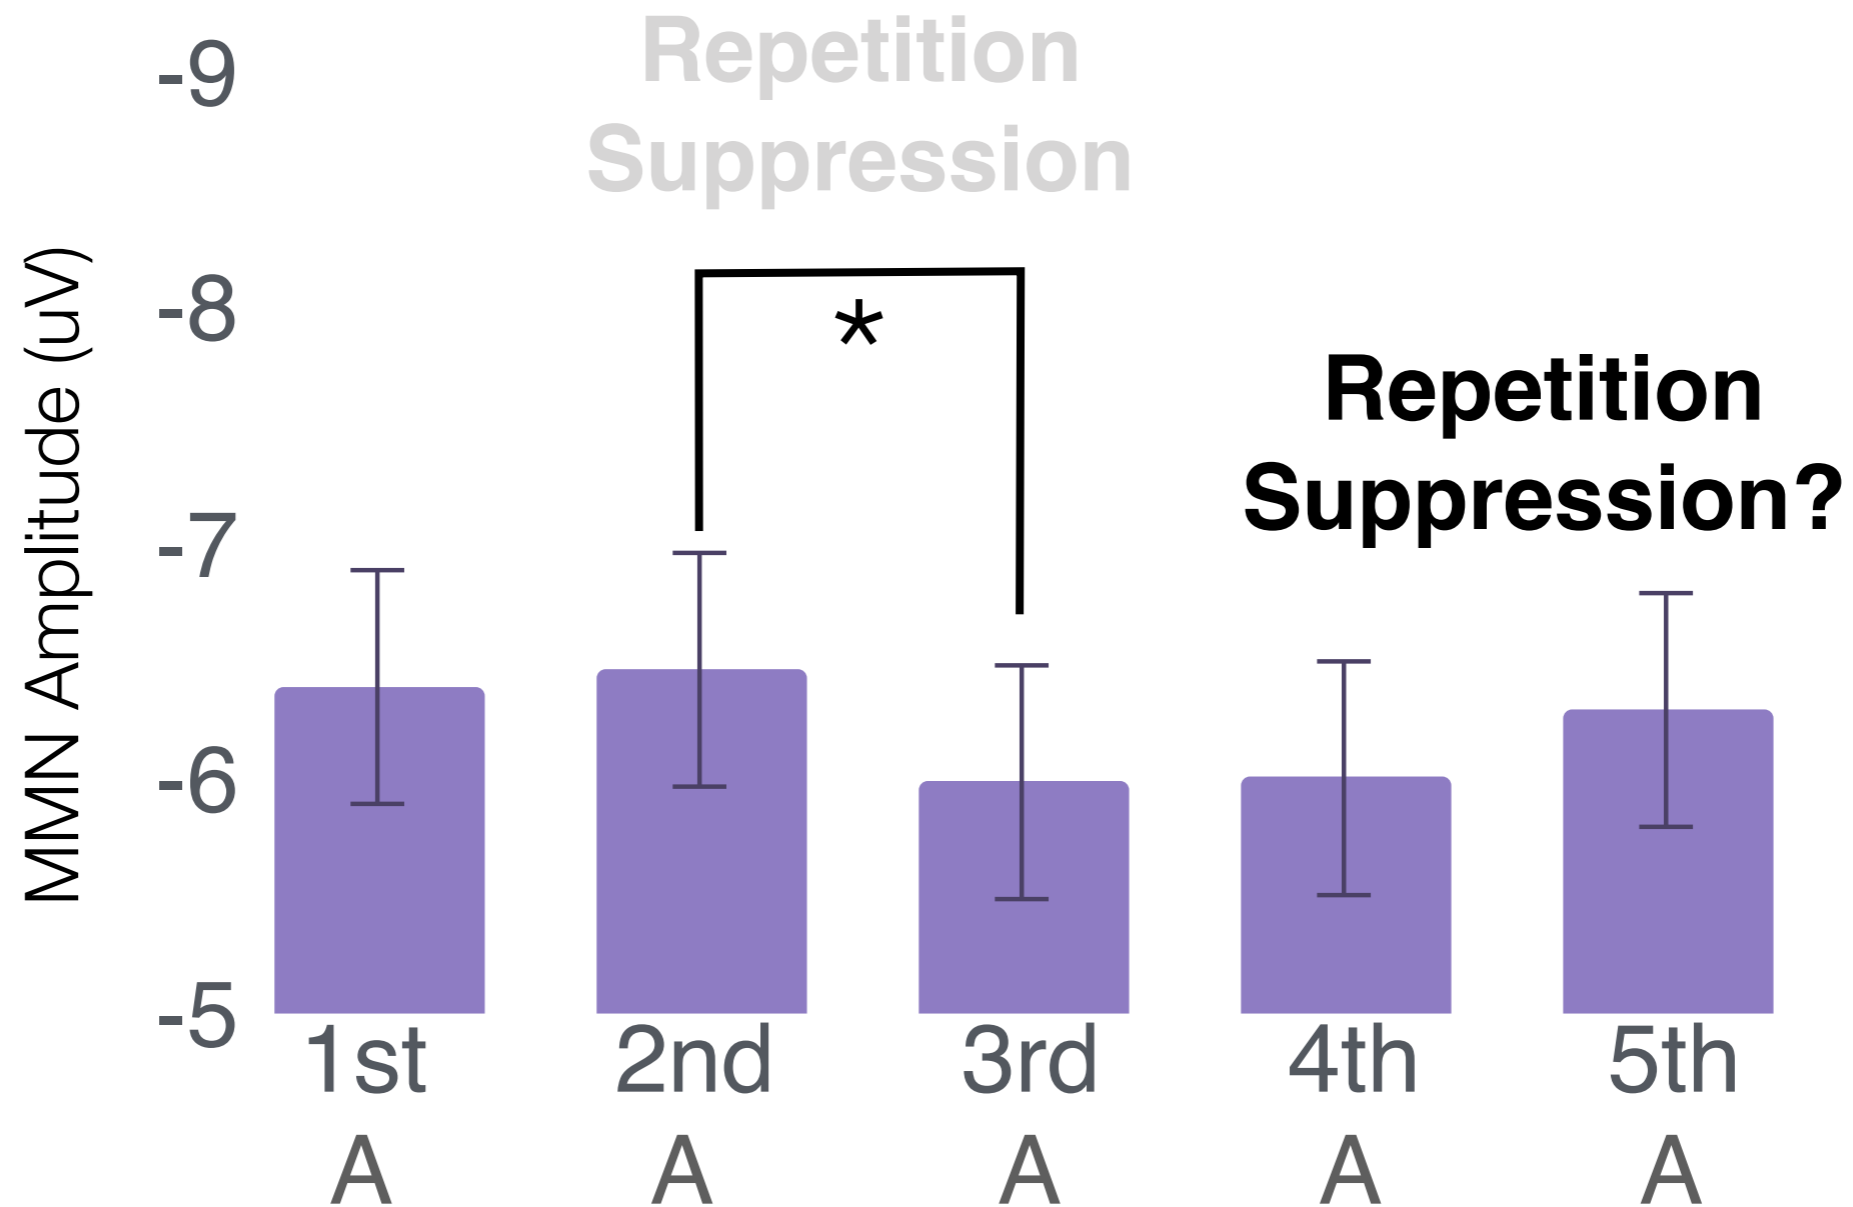

- **Dev 1**, **Dev 2** and **Dev 3** randomly appeared
- **RQ 2.** Can our modulations reduce RS?

Result

Observe Repetition Suppression
in Isolated Session

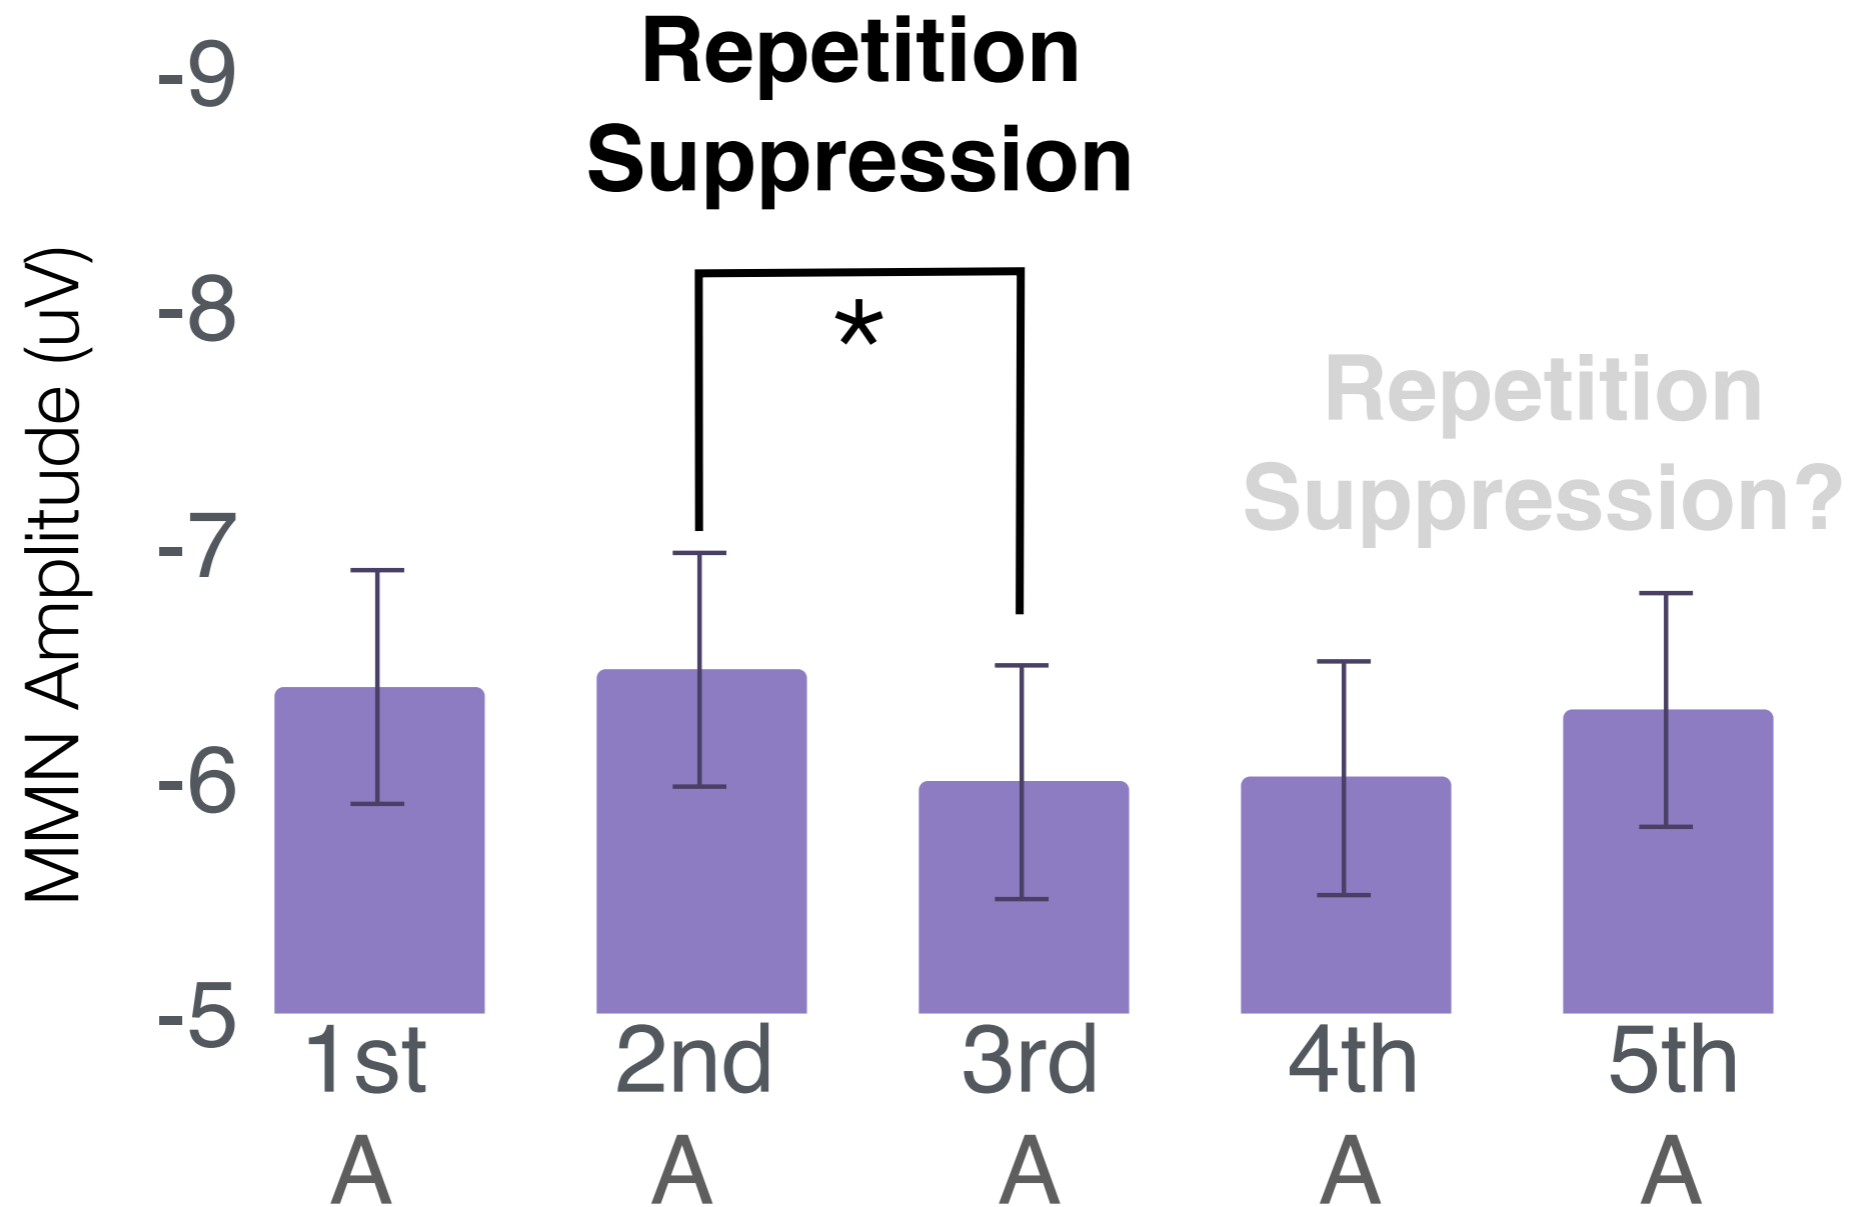

Auditory detection **decreased** in 3rd repetition

RS has **attention**-dependent & **attention**-independent processes

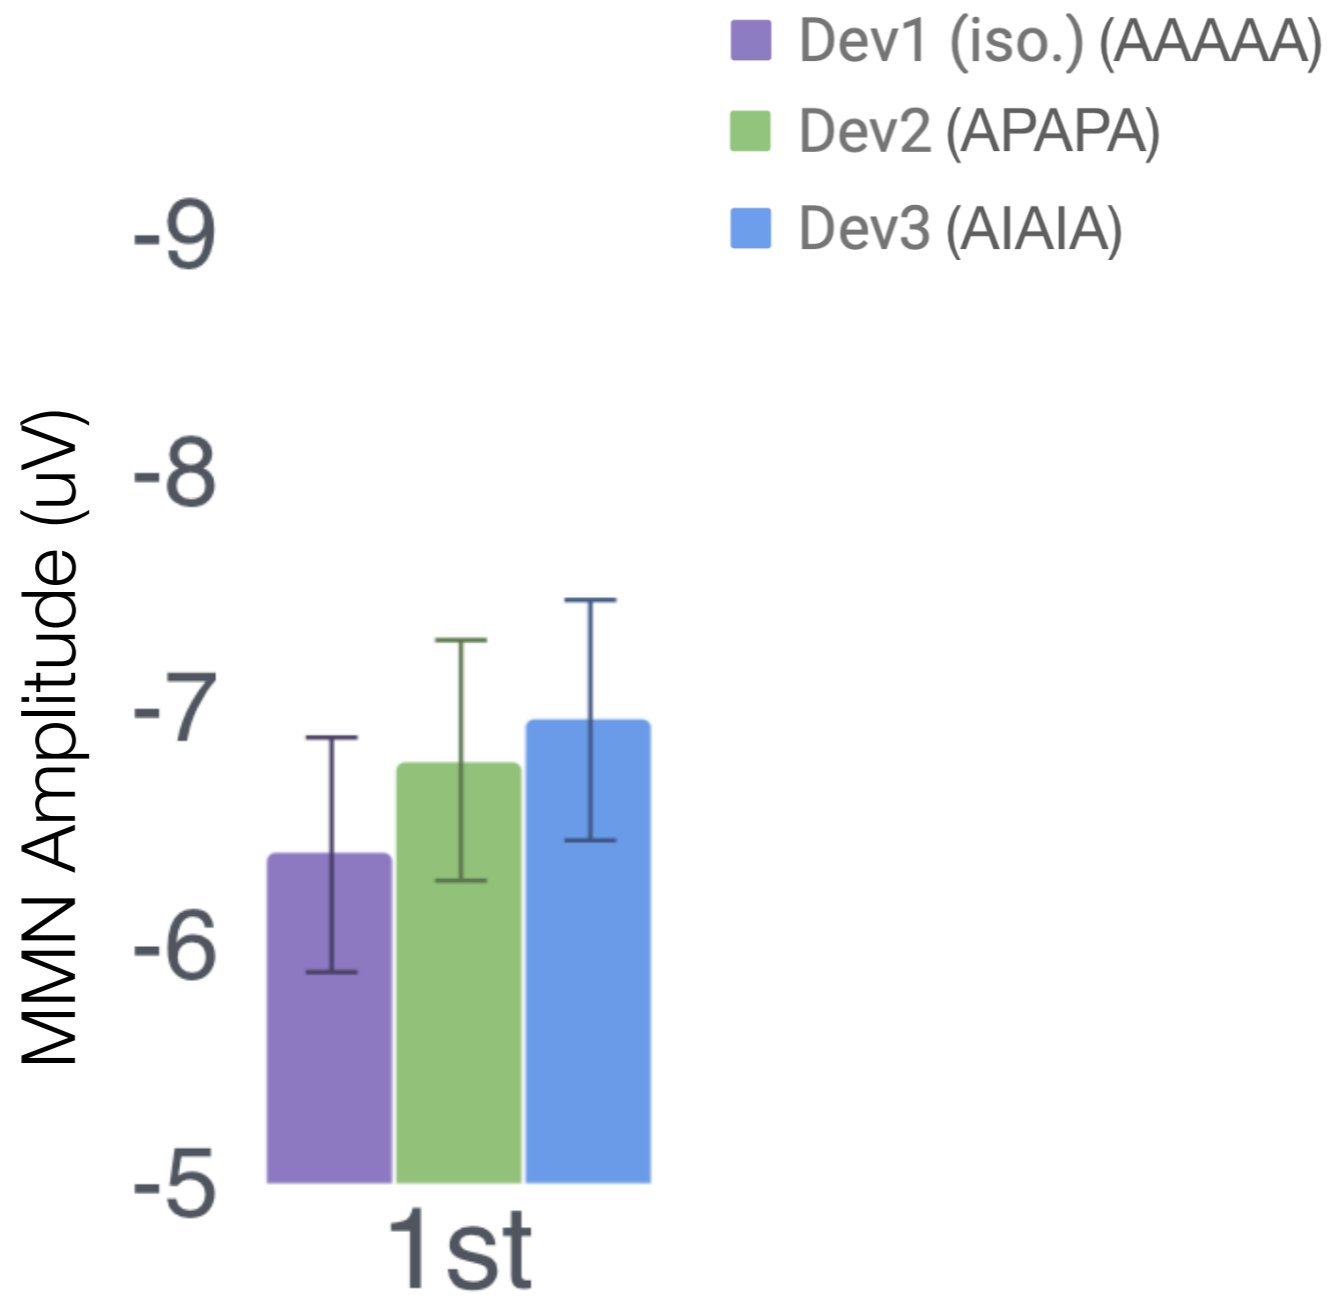

[Hsu, 2014; Grotheer, 2016]

RS happens in the 3rd repetition

Result

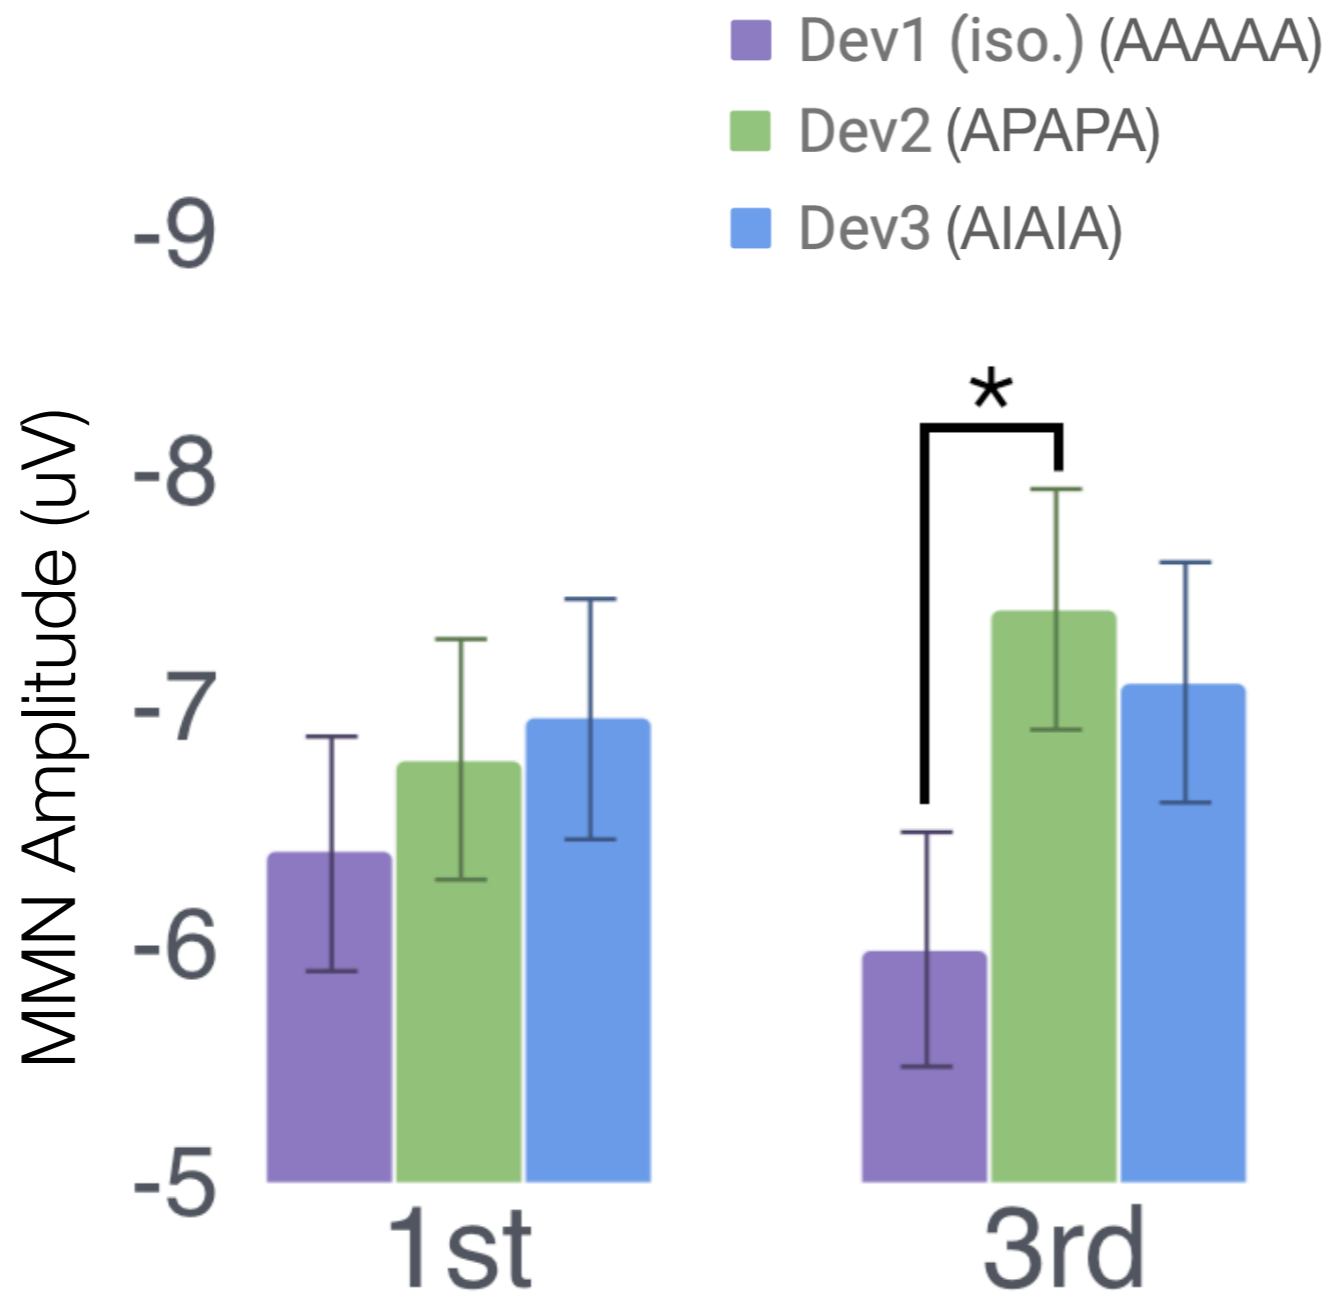

Modulations Reduce RS

Dev 1 (iso.) **A**

Dev 2 **A**

Dev 3 **A**

Dev 1 (iso.)	A	A	A
Dev 2	A	P	A
Dev 3	A	I	A

Modulations **reduce RS** by evoking higher MMN amplitude

Pitch & **intensity** modulation reduce RS differently

Pitch modulation reduces RS in **3rd** repetition

Intensity modulation reduces RS only in **5th** repetition but has **stronger** effect

Study Repetition Suppression in a more realistic setting

- Use real-life ambient sound & more repetition
- When design **repeating alarm**, should take **RS** into account
- Adopt the **modulation** methods to reduce RS

Pitch & Intensity Modulations

Reduce RS Differently

- **Pitch modulation** reduces RS **earlier**
 - Good for time-sensitive situations
- **Intensity modulation** reduces RS **later** but **stronger**
 - Good for situations when quick response isn't crucial

Appendix

Future Works

- More participants (N=14)
- More modulation method (source location, tempo)
- More repetition patterns (AAPAA, APAIA)
- Different ambient sounds

There is no RS effect for modulated alarms on pre-attentive auditory detection

Intensity-modulated alarms are more easily to be detected than the unmodulated alarms
